EA1 Reflection Markdown Report

The expectations for the activity were to use the skills we had learned throughout the various presentations and use IBM Bob to produce a proof-of-concept program that we would submit to the event. To do this I just made a simple program that converted between PST and EST time zones because I had spent most of my time at the event attending the various lectures and panels offered by engineers. I did this because I wanted a better understanding of how IBM Bob is used in the industry and what it can do. The technical decisions I took regarding my program were something simple and within what I knew how to do. I just decided to make the simple outline for my program by making all the methods and then had IBM Bob do the rest, like was discussed during the panels I attended. We were supposed to participate with a team but there weren't any spots open when I had finished going to the lectures, so I just decided to make something on my own with the limited amount of time that I had. I think my contributions during this event were not that much, mostly because I wanted to attend lectures. However, I think my small program was a good contribution that highlighted how to use IBM Bob in accordance with how the industry uses it. It was good practice for industry use, which was of good quality regarding my program fulfilling the requirements.
